

FORMHER LS-215

Formulations for floors

SPECS	TYPICAL VALUE
Character	Anionic/Non-ionic
Solids content (%)	25 ± 1
pH	9 ± 1
Color	Translucent cream

FORMHER LS-215 is a mixture of polyethylene wax emulsion and acrylic dispersion usable in floor maintenance and cleaning. It provides breathability, protection, elasticity and renewal of the finish that has suffered wear or deterioration.

The concentration for domestic use is 10 to 20%, depending on the finish you want to obtain. In all formulations it is necessary to incorporate an appropriate bacterial preservative and we recommend using softened water for dilution for greater stability.

FORMHER LS-215 is used:

- For use concentrated or diluted in water.
- For all types of floors: terrazzo, marble, PVC, tile, parquet...
- As a shine renewer.

PRESENTATION:

Drum of 120 kg
IBC of 1000 kg

What is outlined in this document is the result of our experience and we offer it for information, but without implying any commitment on our part. The results in each particular application must be tested by those directly responsible for the specific formulation.
